

Table 5.1 Guidelines for known-pathogen therapy

	Drug of choice	Alternatives	Remarks
<i>Acinetobacter baumannii</i>	I.V. ampicillin-sulbactam + an aminoglycoside	<ul style="list-style-type: none"> • I.V. cefoperazone-sulbactam + an aminoglycoside (mixed infection with <i>P. aeruginosa</i>) • Fluoroquinolone + an aminoglycoside (if allergic to penicillin) 	<ul style="list-style-type: none"> • Sulbactam is highly active against <i>Acinetobacter</i> • Resistance rates in 2010: ampicillin-sulbactam (24%), cefoperazone-sulbactam (24%), imipenem (37%), gentamicin (32%), amikacin (25%), ciprofloxacin (50%) • For multidrug-resistant isolates: consult microbiologist or infectious disease physician
<i>Clostridium difficile</i>	P.O. metronidazole (404–405)	P.O. vancomycin (if metronidazole fails as documented microbiologically)	<ul style="list-style-type: none"> • Mild/moderate disease: clinical efficacy of metronidazole = vancomycin • Severe disease, ileus or toxic megacolon: I.V. metronidazole + P.O. vancomycin + consult surgeon • First recurrence: same as primary infection based on severity of disease • Multiple recurrence: consult microbiologist or infectious disease physician, options include vancomycin taper or faecal microbiota transplant (406)

	Drug of choice	Alternatives	Remarks
<p><i>Enterobacter cloacae</i> complex</p>	<ul style="list-style-type: none"> • P.O./I.V. levofloxacin/ ciprofloxacin for urinary tract infection • I.V. cefepime (± an aminoglycoside) for severe infection • I.V. piperacillin-tazobactam 	<ul style="list-style-type: none"> • I.V. carbapenem (for severe infection and/or ESBL-producing strain) 	<ul style="list-style-type: none"> • Cefepime is highly active in vitro against almost all <i>Enterobacter</i> isolates • Emergence of AmpC derepressed mutants emerge in 20–40% of infections treated with the second or third generation cephalosporins. Use of these agents for serious infections is not recommended • One study in HK found high prevalence of ESBL production among <i>E. hormaechei</i> (a member of the <i>E. cloacae</i> complex) (407) • Resistance rate in 2010: levofloxacin (8%), gentamicin (4%), amikacin (1%) • For multidrug-resistant isolates: consult microbiologist or infectious disease physician

	Drug of choice	Alternatives	Remarks
<i>E. coli</i> (ESBL-neg)	<ul style="list-style-type: none"> I.V./P.O. ampicillin-sulbactam or amoxicillin-clavulanate (add an aminoglycoside if rapid bactericidal action desirable on clinical grounds) 	<ul style="list-style-type: none"> I.V./P.O. cefuroxime (if resistant to amoxicillin-clavulanate), add I.V./P.O. metronidazole (if mixed infection with anaerobes likely) I.V. piperacillin-tazobactam + an aminoglycoside (if <i>P. aeruginosa</i> or <i>Acinetobacter</i> are co-pathogens) 	
<i>Haemophilus influenzae</i>	<ul style="list-style-type: none"> P.O. amoxicillin or P.O./I.V. ampicillin-sulbactam or amoxicillin-clavulanate or cefotaxime or ceftriaxone 	<ul style="list-style-type: none"> Fluoroquinolones (if allergic to penicillin) 	<ul style="list-style-type: none"> Amoxicillin-clavulanate also provides good coverage for <i>M. catarrhalis</i> and <i>S. pneumoniae</i>

	Drug of choice	Alternatives	Remarks
<i>Klebsiella pneumoniae</i> (ESBL-neg)	<ul style="list-style-type: none"> I.V./P.O. ampicillin-sulbactam or amoxicillin-clavulanate (add an aminoglycoside if rapid bactericidal action desirable on clinical grounds) 	<ul style="list-style-type: none"> I.V./P.O. cefuroxime (if resistant to amoxicillin-clavulanate), add I.V./P.O. metronidazole (if mixed infection with anaerobes likely) I.V. piperacillin-tazobactam + an aminoglycoside (if <i>P. aeruginosa</i> or <i>Acinetobacter</i> are co-pathogens) 	<ul style="list-style-type: none"> Ampicillin-sulbactam less satisfactory because of poor inhibitory activity of sulbactam for SHV-1 β-lactamase
<i>E. coli</i> / <i>K. pneumoniae</i> (ESBL-pos)	<ul style="list-style-type: none"> P.O. nitrofurantoin or P.O. amoxicillin-clavulanate (uncomplicated urinary tract infection and other mild infections) 	<ul style="list-style-type: none"> Carbapenem or I.V. β-lactam/β-lactamase inhibitor for bacteraemia or other serious infection 	<ul style="list-style-type: none"> Carbapenem has been shown to be effective clinically and is currently the β-lactam agent of choice for serious infection by ESBL-pos <i>E. coli</i>/<i>Klebsiella</i> spp.

	Drug of choice	Alternatives	Remarks
<i>Pseudomonas aeruginosa</i>	I.V. piperacillin or ticarcillin-clavulanate or piperacillin-tazobactam + an aminoglycoside	<ul style="list-style-type: none"> I.V. cefoperazone-sulbactam + an aminoglycoside (mixed infection with <i>Acinetobacter</i>) I.V./P.O. levofloxacin/ciprofloxacin + an aminoglycoside (if allergic to penicillin) 	<ul style="list-style-type: none"> Combination therapy recommended (for synergism) for all serious infection except for uncomplicated catheter-related bacteraemia Piperacillin-tazobactam used instead of ceftazidime due to rapid rise in AmpC type and ESBL-producers in <i>Enterobacteriaceae</i> For multidrug-resistant isolates: consult microbiologist or infectious disease physician
Methicillin-sensitive <i>S. aureus</i>	P.O./I.V. cloxacillin or amoxicillin-clavulanate or ampicillin-sulbactam or first generation cephalosporin	<ul style="list-style-type: none"> I.V. cefazolin (if allergic to penicillin, but limited to those with minor allergy such as rash alone) Clindamycin (if allergic to penicillin) 	

	Drug of choice	Alternatives	Remarks
<p>Methicillin-resistant <i>S. aureus</i></p>	<p>I.V. vancomycin (bacteraemia or other invasive infections)</p>	<ul style="list-style-type: none"> I.V./P.O. linezolid or I.V. daptomycin if (1) vancomycin allergy - extensive rash, other than red-man syndrome develop after vancomycin, or (2) bacteraemia caused by MRSA with vancomycin $\geq 2 \mu\text{g/mL}$ 	<ul style="list-style-type: none"> Cotrimoxazole, fusidic acid or rifampicin are useful adjuncts for deep-seated infections (e.g. osteomyelitis) but these agents should not be administered as monotherapy Most abscesses or uncomplicated skin and soft tissue infection caused by CA-MRSA could be treated with drainage and oral antibiotics with in vitro activities (e.g. clindamycin or cotrimoxazole) Vancomycin intermediate <i>Staphylococcus aureus</i>/ vancomycin resistant <i>Staphylococcus aureus</i>: consult microbiologist or infectious disease physician
<p><i>Mycoplasma pneumoniae</i></p>	<ul style="list-style-type: none"> P.O. doxycycline (or I.V. minocycline) 	<ul style="list-style-type: none"> P.O. azithromycin I.V./P.O. levofloxacin or moxifloxacin 	<ul style="list-style-type: none"> Doxycycline preferred over azithromycin in view of increasing macrolide resistant <i>Mycoplasma pneumoniae</i> (379)

	Drug of choice	Alternatives	Remarks
<p><i>Stenotrophomonas maltophilia</i></p>	<p>P.O./I.V. cotrimoxazole + I.V. ticarcillin-clavulanate</p>	<ul style="list-style-type: none"> I.V./P.O. cotrimoxazole + fluoroquinolone 	<ul style="list-style-type: none"> Cotrimoxazole + ticarcillin-clavulanate is synergistic in vitro. Cotrimoxazole is a key component in therapy Combination therapy recommended for synergy and to prevent resistance For cotrimoxazole-resistant strain, consult microbiologist or infectious disease physician
<p><i>Streptococcus pneumoniae</i> (for infection outside the central nervous system)</p>	<ul style="list-style-type: none"> Penicillin-sensitive: I.V. penicillin G (4–8 million unit/day, q6h) Penicillin-intermediate: I.V. penicillin G (high dose, 12–18 million unit/day, q4h)¹ Penicillin-resistant: I.V. cefotaxime or ceftriaxone 	<ul style="list-style-type: none"> β-lactam/β-lactamase inhibitor combination with the exception of cefoperazone-sulbactam (for mixed infections) P.O./I.V. levofloxacin or P.O./I.V. moxifloxacin (if allergic to penicillin) for non-meningeal infections and penicillin-sensitive strains 	<ul style="list-style-type: none"> Most pneumococcal pneumonia can be treated with high dose amoxicillin or high dose amoxicillin-clavulanate For pure pneumococcal infection, penicillin G instead of amoxicillin-clavulanate is preferred, switch therefore recommended >70% resistant to erythromycin. Cross-resistance to clindamycin is very common Resistance to erythromycin = resistance to other newer macrolides (clarithromycin, azithromycin)

	Drug of choice	Alternatives	Remarks
<i>Streptococcus pneumoniae</i> (for central nervous system infection)	<ul style="list-style-type: none"> • Penicillin-sensitive (MIC \leq 0.06 $\mu\text{g}/\text{mL}$): I.V. penicillin G (18–24 million unit/day, q4h) or I.V. ampicillin 2 g q4h • Penicillin-resistant (MIC \geq 0.12 $\mu\text{g}/\text{mL}$) and third-generation cephalosporin (MIC $<$ 1 $\mu\text{g}/\text{mL}$): I.V. cefotaxime 2 g q4h or I.V. ceftriaxone 2 g q12h • Penicillin-resistant (MIC \geq 0.12 $\mu\text{g}/\text{mL}$) and third-generation cephalosporin (MIC \geq 1 $\mu\text{g}/\text{mL}$): I.V. vancomycin plus I.V. cefotaxime 2 g q4h or ceftriaxone 2 g q12h 		<ul style="list-style-type: none"> • MIC (meningitis) breakpoints for penicillin, ceftriaxone and cefotaxime to be used here • In <i>S. pneumoniae</i>, cross resistance between penicillin and ceftriaxone/cefotaxime is common (391,408). Local data indicates that approximately half of the penicillin-resistant (meningitis) isolates are intermediate/resistant (meningitis) to cefotaxime

Note:

¹ CLSI MIC ($\mu\text{g}/\text{mL}$) breakpoints for penicillin G: sensitive \leq 0.06; intermediate 0.12–1; resistant \geq 2. These breakpoints were decided mainly for the relevance on meningitis. For pneumococcal pneumonia, pharmacokinetic/dynamic data indicates that isolates with MIC of up to 1–2 $\mu\text{g}/\text{mL}$ should be considered ‘sensitive’ to appropriate dose of penicillin, ampicillin and amoxicillin.
